* DEMPLUS AND REPPLUS. These are extensions of Democratic and Republican voters that reach into the behavior of Independent voters who are actually partisan in their actions. DEMPLUS are either Democrats or non-partisans that pull a Democratic ballot, were Democrats, or donate to Democrats. The inverse is true for REPPLUS. In some Redistricting Partners / RP Data analysis these DEMPLUS and REPPLUS categories have been more strongly partisan than the identified party members.

** OTHER MODELS AS DEM/REP. The "Other" category in PDI has always been anyone who is not a DEM or REP. PDI has done some significant investment in modeling these previously "unidentified" voters into either having Democratic or Republican leanings. The model is based in part on the information we know about the voter and in part what we know about where they live and the voting actions of their precinct. This is a new measure that some consultants are using to prioritize these voters.

* DEMPLUS AND REPPLUS. These are extensions of Democratic and Republican voters that reach into the behavior of Independent voters who are actually partisan in their actions. DEMPLUS are either Democrats or non-partisans that pull a Democratic ballot, were Democrats or donate to Democrats. The inverse is true for REPPLUS. In Redistricting Partners / Rp data analysis these DEMPLUS and REPPLUS categories have been more strongly partisan than the identified party members.

** OTHER MODELS AS DEM/REP. The "Other" category in PDI has always been anyone who is not a DEM or REP. PDI has done some significant investment in modeling these previously "unidentified" voters into either having Democratic or Republican leanings. The model is based in part on the information we know about the voter and in part what we know about where they live and the voting actions of their precinct. This is a new measure that some consultants are using to prioritize these voters.

** TURNOUT MODELS. PDI uses preset universes incorporating the the traditional voting behavior used by most campaigns in targeting. The PDI universes can be found here: http://www.politicaldata.com/Pages/images/2012_General.pdf. For the purposes of this report we look at performance in the 12G1, 12G4

* DEMPLUS AND REPPLUS. These are extensions of Democratic and Republican voters that reach into the behavior of Independent voters who are actually partisan in their actions. DEMPLUS are either Democrats or non-partisans that pull a Democratic ballot, were Democrats or donate to Democrats. The inverse is true for REPPLUS. In Redistricting Partners / RP Data analysis these DEMPLUS and REPPLUS categories have been more strongly partisan than the identified party members.

** OTHER MODELS AS DEM/REP. The "Other" category in PDI has always been anyone who is not a DEM or REP. PDI has done some significant investment in modeling these previously "unidentified" voters into either having Democratic or Republican leanings. The model is based in part on the information we know about the voter and in part what we know about where they live and the voting actions of their precinct. This is a new measure that some consultants are using to prioritize these voters.

** TURNOUT MODELS. PDI uses preset universes incorporating the the traditional voting behavior used by most campaigns in targeting. The PDI universes can be found here: http://www.politicaldata.com/Pages/images/2012_General.pdf. For the purposes of this report we look at performance in the 12G1, 12G4B and 12G5C Universes. In addition, PDI has done some extensive modeling of turnout based on the same kind of criteria as above along with factors like income, ethnicity, age, and voting behavior of others of similar background. This turnout modeling has resulted in a score for each voter identifying their likelihood of voting in November. The last page of this report identifies VBM voters that fall into the 75% turnout and 65% turnout counts.

* DEM+ AND REP+. These are right under Dem and Rep respectively. DEM + are either DEM or voters that are non-partisan/minor party but have Democratic Actions – like they pull a Democratic ballot, were Democrats or donate to Democrats. The inverse is true for REP +.

** OTHER MODELS AS DEM/REP. The "Other" category has always been anyone who is not a DEM or REP. We have done some significant investment in modeling these previously "unidentified" voters into either having Democratic or Republican leanings. The model is based in part on the information we know about the voter and in part what we know about where they live and the voting actions of their precinct. This is a new measure that some consultants are using to prioritize these voters. As an example, the Democratic candidate may choose to not mail those non-partisans who model as a Republican.

** TURNOUT MODELS. PDI uses preset universes incorporating the traditional voting behavior used by most campaigns in targeting. The PDI universes can be found here: http://www.politicaldata.com/Pages/images/2012_General.pdf. For the purposes of this report we look at performance in the 12G1, 12G4B and 12G5C Universes. In addition, PDI has done some extensive modeling of turnout based on the same kind of criteria as above along with factors like income, ethnicity, age, and voting behavior of others of similar background. This turnout modeling has resulted in a score for each voter identifying their likelihood of voting in November. The last page of this report identifies VBM voters that fall into the 75% turnout and 65% turnout counts.

* DEM+ AND REP+. These are right under Dem and Rep respectively. DEM + are either DEM or voters that are non-partisan/minor party but have Democratic Actions – like they pull a Democratic ballot, were Democrats or donate to Democrats. The inverse is true for REP +.

** OTHER MODELS AS DEM/REP. The "Other" category has always been anyone who is not a DEM or REP. We have done some significant investment in modeling these previously "unidentified" voters into either having Democratic or Republican leanings. The model is based in part on the information we know about the voter and in part what we know about where they live and the voting actions of their precinct. This is a new measure that some consultants are using to prioritize these voters. As an example, the Democratic candidate may choose to not mail those non-partisans who model as a Republican.

** TURNOUT MODELS. PDI uses preset universes incorporating the traditional voting behavior used by most campaigns in targeting. The PDI universes can be found here: http://www.politicaldata.com/Pages/images/2012_General.pdf. For the purposes of this report we look at performance in the 12G1, 12G4B and 12G5C Universes. In addition, PDI has done some extensive modeling of turnout based on the same kind of criteria as above along with factors like income, ethnicity, age, and voting behavior of others of similar background. This turnout modeling has resulted in a score for each voter identifying their likelihood of voting in November. The last page of this report identifies VBM voters that fall into the 75% turnout and 65% turnout counts.
